

Acid filling process for solar container lead-acid batteries

Overview

The filling process involves inverting the electrolyte container over the battery and allowing the acid to drain slowly and steadily into each cell. These batteries are shipped without the sulfuric acid solution to maximize their shelf life, as the chemical. During the battery container formation process, a one-way valve is adopted to control the discharging of acid smog, and the acid extracting process after the battery container formation is also saved, so the Abstract In Part A of this study, eight lead-acid battery cells were formed to different.
