

Drilling accumulator location

Overview

The accumulator shall be located at a remote location, at least 60 feet distance from the wellbore for oil wells and 100 feet for gas wells, shielded from the wellhead and protected from other operations around the rig. Top loading means the bladder or float can be removed from the top while it is still mounted on the accumulator unit. Selecting the right BOP accumulator units and BOP closing units is critical to ensuring dependable hydraulic power for blowout preventers across drilling, completion, and well intervention activities in the oil and gas industry. This sophisticated device plays a significant role in maintaining the overall efficiency of drilling operations. A BOP Control Accumulator Unit—often called a Koomey BOP Control Unit or simply a Koomey unit—stores and delivers hydraulic energy to close.
