

Embedded energy equipment storage project

Overview

Recent advances in flexible and scalable electrical energy storage technologies have made the concept of embedded storage on the electric grid feasible, but complex regulatory issues must be resolved before it can be practical. This embedded storage creates a buffer for mismatches between supply and demand, stabilizing prices, and protecting customers. The project is focused on the development and performance optimization for next-gen HPWH with embedded energy storage solution. Unlike centralized megawatt-scale solutions, embedded systems integrate directly with energy equipment. Imagine HVAC units with built-in battery banks that charge during off-peak hours.
