

# Is the air-cooled chiller solar container device a pressure vessel

## Overview

---

Pressure vessels are closed containers that are specially designed to create internal pressures that are higher or lower than ambient pressure. They vary greatly in shape, size, composition, and operating limits depending on the application in which they are used. These chillers have been designed for the efficient use of low-grade heat sources; some are air-cooled, small capacity systems; compact water/LiBr chillers; or solar-gas-fired single/double-effect chillers. Also, some advanced commercial absorption chillers have an extensive temperature glide in. Fortunately, Carrier chillers have you covered, ensuring the cooling your guests and crew demand, all with maximum reliability and efficiency.
