Overview

A solar steam generator is a device that uses sunlight to generate steam for various applications. It harnesses the power of solar energy to heat water or another working fluid, which then produces steam. Here are some key features and considerations related to solar steam generators Solar. The main heat exchange equipment of solar boiler photovoltaic power generation steam generation system includes steam bag, evaporator, reheater, superheater and preheater. It tracks the radiations of Sun through automated tracking device, which rotates the parabolic dish along axis of rotation of Sun. •Tie up with 16 modules of protarget'sCF100 parabolic trough collectors is equipped with CF115 receiver tubes and employs a new , environmental friendly, silicone heat transfer fluid Helicol 5a with multi layer solar selective coating which has an absorptance of more than 93% and an emittance of.
