

Requirements and specifications for retaining wall materials of solar container power stations

Overview

Review the key requirements of ASTM C1372 for segmental retaining wall units, including compressive strength, absorption limits, dimensional tolerances, and freeze-thaw durability standards. This technical specification manual will allow a wall design-er to source and reference specific information for use in developing project documents. Included are: prod-uct standards, installation and water management pro-cedures, design details, industry standards, allowable construction. This manual is intended primarily for retaining walls which will be subjected to hydraulic loadings such as flowing water, submergence, wave action, and spray, exposure to chemically. Earth pressure depends on type of backfill, th \square =Unit weigh or density of b ng, then. This publication, including without limitation all editorial materials, informational text, photographs, illustrations, artwork and other graphic materials, and names, logos, trademarks, and service marks, are the property of the Solar Energy Industries Association, Inc® (SEIA®) and are protected. However if the retaining wall is four feet (4') in height or greater (measured from the bottom of the footing to the top of the wall) and any retaining wall supporting a surcharge or impounding Class I, II, or IIIA liquids.
