

Secondary solar container of thermal power

Overview

Here, we provide an overview of the technology to unify solar receivers and thermal energy storage into a single system. We discuss the advantages, challenges, and prospects associated with this innovative approach. In a concentrating solar power (CSP) system, the sun's rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use. Researchers in the Stanford School of Sustainability have patented a sustainable, cost-effective, scalable subsurface energy storage system with the potential to revolutionize solar thermal energy storage by making solar energy available 24/7 for a wide range of industrial applications.
