

Tand is the storage modulus

Overview

The storage modulus represents the amount of energy stored in the elastic structure of the sample. Our thought experiment therefore gives us two bits of information: the "phase" angle difference δ between the stimulus (stress) and response (strain) and the modulus, G^* from $\text{Maximum_Stress/Maximum_Strain}$. Thermoplastic and thermoset solids are routinely tested using Dynamic Mechanical Analysis or DMA to obtain accurate measurements of such as the glass transition temperature (T_g), modulus (G') and damping ($\tan \delta$).
