

The role of solar container in thermal power plants

Overview

In a concentrated solar power (CSP) plant, collectors concentrate solar radiation and heat a fluid that transfers the heat to a storage tank. This heat is then used to produce steam that drives turbines and generates electricity, even at night. The demand for renewable energy sources has made TES integration within CSP facilities a viable solution to stabilize solar energy availability. Concentrating solar power (CSP) is naturally incorporated with thermal energy storage, providing readily dispatchable electricity and the potential to contribute significantly to grid penetration of high-percentage renewable energy sources.
