

## Overview

---

A solar water heating system uses sunlight to heat water through solar collectors, usually mounted on rooftops. These collectors absorb solar energy and transfer it to a fluid, which then circulates through a heat exchanger, heating the water that is used in your home. The solar cooker uses the energy of the sun directly for preparing food just like the plants that use sunlight to prepare their food. Demineralized water in the boiler into qualified superheated steam, after heating.
