

# What are steam solar container tanks used for

## Overview

---

Additionally, in the renewable energy sector, particularly in concentrated solar power systems, steam storage tanks play a pivotal role. They allow for the storage of thermal energy generated during sunlight hours, which can then be utilized during periods of low sunlight. This enables CSP systems to be flexible, or dispatchable, options for providing clean, renewable. Steam storage tanks are essential components in various industrial applications, acting as reservoirs for accumulated steam. The cheapest way to store solar energy over many hours, such as the five to seven hour evening peak demand now found in more places around the world is in thermal energy. CSP plants typically use two types of fluids: (1) heat-transfer fluid to transfer the thermal energy from the solar collectors through the pipes to the steam generator or storage.
