

# **What is the essence of compressed air solar container**

## Overview

---

The primary element is a high-pressure storage tank, typically made from reinforced steel or composite materials, designed to safely contain compressed air at pressures between 100 and 300 bar. Compressed Air Energy Storage is a technology that stores energy by using electricity to compress air and store it in large underground caverns or tanks. When energy is needed, the compressed air is released, expanded, and heated to drive a turbine, which generates electricity. At a utility scale, energy generated during periods of low demand can be released during peak load periods.
